

STABILIZATION IN A RADAR LEVEL GAUGE

ABSTRACT OF THE DISCLOSURE

A radar gauge adapted to sense fluid level in a tank and including a radar gauge circuit in which radar transmission and level sampling are controlled by a transmit frequency and a sample frequency respectively. A first frequency separation between first and second frequencies is controlled by a control input. The first and second frequencies can be divided to generate the transmit and sample frequencies, separated by a second frequency separation. At least one frequency difference is evaluated and the evaluation used to generate the control input, stabilizing the first frequency difference, and to correct the gauge output.

Figure 1. The 16 different types of the *Phragmites* community in the coastal wetlands of the Yangtze River Delta. The numbers in the boxes are the number of communities in each type. The numbers in the parentheses are the number of communities in each type that are in the Yangtze River Delta. The numbers in the circles are the number of communities in each type that are in the Yangtze River Delta.
